Continuation of 11. does NOT place the application in condition for allowance because: the Minagawa reference has been used as the main reference in the case because the applicant has claimed a pressure estimating method in his first claim that is used to set the injector pulse period. Minagawa teaches this feature. Powell teaches the use of a constant rate in the rail using a spring-biased regulator. The two systems are dissimilar in the manner noted by the applicant, but are also very similar in the ways noted by the examiner. As noted in the final rejection, the Minagawa system is more sophistocated in that the pressures are varied but it still would have been obvious to use a constant pressure in that system since such systems (used in returnless common rail environments) were well known at the time.
